[PRD] Agentic Lead Generation and Scheduling for SMBs.

Problem Alignment

Introduction and Opportunity

> The rise of chatbots and agentic AI has reshaped how businesses engage with customers for sales and service delivery. While large enterprises rely on dedicated CRM software and catalog-driven platforms with integrated AI capabilities, the majority of SMBs in India continue to operate primarily through WhatsApp and phone calls. Both business owners and customers prefer simple, conversational communication over migration to complex interfaces.

> This presents an opportunity to bring agentic capabilities directly into the communication channels SMBs already use without forcing them to adapt to heavy and unfamiliar systems.

Existing Pain Points

- Fragmented processing where lead capture and fulfilment are handled seperately.
- Leads are often lost during the non-functioning hours and when the admin is away.
- N-number of repeated queries overhwhelms the admin.
- Manual replies are slow without any structured follow up strategy whereas static auto replies do not capture the context of the customer.

Background and Evidence

Current Market

- Globally, over **50M+ organizations** use instant messengers like Whatsapp as part of their CRM toolkit. This is further amplified in markets like **India and Brazil** where there are **550M+ whatsapp users** (Source : meta).
- **~78% of Indian SMBs** (Source : HyperleapAI) use whatsapp and phone calls to communicate with customers and generate leads.
- **65% of businesses** report increased sales **72% of customers prefer** instant chat over email for business communication.

Top Triggers for businesses

1. Seamless CRM integration.
2. Automation and agentic control with unlimited conversation capacity.
3. 24/7 availability.
4. Better Response speed affecting revenue and retention.

Top use cases

1. Order tracking, product recommendations.
2. Appointment booking.
3. Enquiries and enrollment.
4. Returns, exchanges and product Info.

Solution Summary

Product Overview

1. Custom built agents that integrate with whatsapp and phone calls to handle routine customer interactions.
2. Context aware automation that understands the target business workflows and task execution.
3. Seamless transition from agentic to manual support within the same conversation.
4. Lighweight and tailored for SMBs, requiring minimal setup and infrastructure.

Core Functionalities (V1)

This version focuses on support, produce/service overview and autonomous appointment scheduling for businesses. Additional use cases to be layed in future iterations.

1. **Lead capture and handling** : Agents that handles the first customer interaction over WhatsApp or calls, understands intent and handles most general queries and product/service catalogue.
2. **Structured data extraction :** Automatically converts conversations into structured customer data (name, requirement etc depending on the use case).
3. **Intelligent appointment scheduling agent :** Autonomously books appointments aligned with business availability and customer preferences.
4. **Smart manual triggers and override :** Allows a business operator to step into the same conversation at any point for more specific interactions and flags conversations that might need more human context.
5. **Business knowledge configuration layer :** Allows businesses to define context i.e set services/products, FAQs, stock availablity and policies so that the agent responds accurately and stays grounded.

Additional :
Insights and analytics layer : Businesses can view metrics on leads converted, retention, sales etc.

Key Design Principles

1. Prioritize automation while allowing human override in critical scenarios with **0% tolerance to compromise on customer experience.**
2. Focus on grounded AI agents with **guardrails to stick to verified data** and **minimize hallucinations.**
3. **Complete trust and transperancy** where all the stakeholders are **aware when AI is acting vs humans.**

Target Users (V1)

→ **User 1**

- Role : Salon Client
- Personality : Organized, hates delays, appreciates convinience.
- User Story :
    1. I want to engage through Whatsapp quickly so that my schedule isn't disrupted.
    2. I want all information in one place so that I don't have to navigate through complex websites and apps for services, pricing etc.
    3. I hate delays and waiting, I would prefer real-time appointment updates and cancellations if any.

→ **User 2**

- Role : Salon Manager
- Personality : Customer first, Busy with managing the salon, open to automation but curious about quality
- User Story :
    1. I want autonomous handling initial cusomter interaction so that I don't miss any lead even when I am not available.
    2. I prefer customer data to be seamlesly captured rather than me manually noting it down.
    3. Repeated queries overwhelm me, I prefer an autonomous reply system that can handle general FAQs related to the services we offer.
    4. I want full liberty to manually step into any agentic conversation and engage with the customer directly.
    5. I should be able to modify my services and pricing at any point of time.

Non - Target Users

1. Large Enterprises with dedicated CRM/ERP solutions

2. Highly complex or custom services requiring extensive consultation, multi-step approvals and highly personalized handling.

Definition of Success (V1)

1. Scheduling efficiency with no double bookings, timely appointment reminders translating to minimal wait times.
2. Improved lead generation with reduction in no responses along accurate data capture.
3. Operational time and effort savings where manual work is decreased in scheduling, follow-ups and data entry.
4. Seamless Human - AI collaboration where customers are happy with the conversation flow.
5. Business owners find it easy to use the system and interpret it.

Risks & Open Questions

Dependency Risks

1. Policy change by external API Providers for chat access and call screening (eg. Whatsapp, Twilio) can cause disruptions.
2. Unreliable internet connections can interrupt AI interactions.
3. AI model updates or depreciation by model providers may cause outages.

Challenges

1. Normalizing target business data and workflows and providing accurate context to the agentic system.
2. Ensuring hallucination free and compliant AI.
3. Personalization context retention where previous customer interactions are rememberd over time (stateful interactions).
4. Security and privacy of customer data complying with DPDP regulations.

5. Scalabilty and performance where the system handles growing conversations and data.
